

Memo from  
JOSHUA LEDERBERG

To: John Totter

APR 15 1971

AEZ

Population exposure to radiation.

Dr. Seaborg's 3/22 speech refers to a level of a microrem per year, calculated from eth  
boundary site constraints.

Does this calculation include reference to water-borne contamination? To ~~RMLX~~ Rulison etc. sources of atmospheric tritium?

If not, are there comprehensive calculations of the total load from peaceful applications of nuclear energy? (I suppose medical uses of isotopes would be a significant part of that load, and should be factored out.)

John.
